Installer Guide

- Installer Guide

Installer Guide

Welcome dear installer! This instance is to outline the basic installation instructions and methods you can use when you will install a network, a server or a fiber connection in someone else's house, building or for any other project. This guide is general in scope and it is always recommended to read the installation guide of your local hub instead. Also, we don't go into details here in how tools work, we only provide here the processes and best practices to install cables, networks and servers in people's homes and apartment complexes. But again this guide is a collection of all the findings from local hub guides and tries to get other hubs of the ground and some starting point to work from.

Therefore, this guide is for hubs and hubs should make their own local versions of it that is related to their local conditions.
